LLM-Driven Feature Discovery

By: AI Alignment Forum

Source: AI Alignment Forum

What's New

Claim
The method of LLM-Driven Feature Discovery can effectively reveal qualitative insights into a target model's behaviors across various distributions.

Evidence
The exploratory project involved splitting model transcripts into three segments and analyzing the outcomes, although specific metrics or results from the analysis were not detailed. The approach suggests an intention to identify novel behaviors and correlations, but lacks comprehensive empirical validation.

Method
The technique involved utilizing large language models (LLMs) to analyze datasets of model transcripts, aiming to discover important features and behaviors of the target model.

Limitations
The study is exploratory and does not provide detailed experimental results, which raises concerns about the generalizability and reproducibility of the findings. Additionally, the scope may be limited to specific types of models or datasets.

Safety relevance
This work presents a potential avenue for improving understanding of model behaviors, which is relevant for enhancing safety measures and evaluation processes in AI systems.
