My research: a computational cognitive neuroscience perspective on alignment

By: AI Alignment Forum

Source: AI Alignment Forum

What's New

Claim
The research aims to predict the characteristics and potential failure modes of the first transformative AI using a computational cognitive neuroscience perspective.

Evidence
The author has been engaged in alignment research for over three years and has been contemplating brainlike AGI since 2004. However, specific empirical evidence or data from experiments to support the predictions is not detailed in the summary.

Method
The approach involves a theoretical framework integrating concepts from computational cognitive neuroscience to analyze AI alignment.

Limitations
The research is primarily theoretical and may lack empirical validation or reproducibility. The scope may also be limited by the speculative nature of predicting future AI systems.

Safety relevance
This work contributes to understanding potential failure modes of AI systems, which is crucial for developing effective alignment strategies.

Full Announcement Details

The research aims to predict the characteristics and potential failure modes of the first transformative AI using a computational cognitive neuroscience perspective. The author has been engaged in alignment research for over three years and has been contemplating brainlike AGI since 2004. However, specific empirical evidence or data from experiments to support the predictions is *not detailed in the summary.*
