

Empowerment, corrigibility, etc. are simple abstractions (of a messed-up ontology)

By: AI Alignment Forum

Source: AI Alignment Forum

What's New

****Claim****

The concepts of empowerment, corrigibility, and helpfulness in AI are fundamentally problematic due to the under-determined nature of human goals, making it difficult to avoid manipulation.

****Evidence****

The discussion highlights that human goals can be influenced and changed in ways that are not easily classified as good or bad, indicating a complexity that current frameworks do not adequately address. No specific experiments or models were mentioned to substantiate this claim.

****Method****

The analysis appears to be primarily conceptual, examining the implications of AI goals through theoretical discourse rather than empirical testing.

****Limitations****

The lack of empirical evidence or case studies limits the robustness of the claims and leaves important questions about practical applicability unresolved.

****Safety relevance****

This perspective suggests that current alignment strategies may overlook the nuanced interactions between AI and human goal formation, which could lead to unforeseen manipulation risks in advanced systems.
