

Sequent: scale and automation for higher confidence in alignment

By: AI Alignment Forum

Source: AI Alignment Forum

What's New

****Claim****

Current alignment efforts are insufficient to ensure safety in the imminent development of artificial superintelligence (ASI).

****Evidence****

The authors assert that existing empirical programs in AI labs are unlikely to provide a priori confidence in alignment before ASI training begins. They emphasize the urgency of establishing a higher standard of confidence through a combination of theoretical and empirical research.

****Method****

The proposed approach involves launching a large nonprofit organization focused on alignment research, which will employ a portfolio strategy that combines various theoretical frameworks and empirical investigations.

****Limitations****

The proposal does not provide specific empirical evidence to support the effectiveness of the new organization's strategy or detail how it will overcome existing challenges in alignment research. There is also a lack of clarity on how success will be measured.

****Safety relevance****

This initiative highlights the pressing need for robust alignment strategies as ASI development accelerates, indicating that current methodologies may not suffice.
