

My research: a computational cognitive neuroscience perspective on alignment

By: AI Alignment Forum

Source: AI Alignment Forum

What's New

****Claim****

The research aims to predict the characteristics and potential failure modes of the first transformative AI through a computational cognitive neuroscience lens.

****Evidence****

The researcher has over three years of full-time experience in alignment and has been contemplating brainlike AGI since 2004, although specific empirical results or experiments are not detailed in the summary. The focus is on mechanistic understanding rather than empirical validation.

****Method****

The approach appears to integrate cognitive neuroscience principles with computational models to theorize about AI alignment, though specific techniques or datasets used are not mentioned.

****Limitations****

The research may lack empirical validation and specific experimental results, leading to potential gaps in reproducibility and generalizability of the claims. The theoretical focus may limit the applicability of findings to real-world AI systems.

****Safety relevance****

This work may inform alignment strategies by providing insights into possible failure modes of emergent AI systems based on cognitive neuroscience frameworks.
