Accelerating the search for antimicrobial peptides with Google Antigravity

From: Google DeepMind

Source: Google DeepMind

The Brief

What shipped
Google Antigravity, an agentic development platform for discovering antimicrobial peptides.

Capabilities
Google Antigravity allows biologists to discover, evaluate, and prioritize antimicrobial peptide candidates by querying millions of protein sequences in the UniProt database using the ProtNLM model, which predicts biological function from amino acid sequences. It integrates structural analysis and literature synthesis in a single interactive session, significantly reducing the time required for candidate identification.

Availability
Not stated.

Why it matters
This platform streamlines the process of identifying novel antimicrobial peptides, enabling applied AI engineers to integrate advanced search and analysis capabilities into their workflows, potentially reducing the time from discovery to validation.

Caveats
The results from the platform still require wet-lab validation, and the effectiveness of the predictions has not been independently verified.

Full Announcement Details

Google Antigravity, an agentic development platform for discovering antimicrobial peptides. Google Antigravity allows biologists to discover, evaluate, and prioritize antimicrobial peptide candidates by querying millions of protein sequences in the UniProt database using the ProtNLM model, which predicts biological function from amino acid sequences. It integrates structural analysis and literature

synthesis in a single interactive session, significantly reducing the time required for candidate identification.
