

Independent alignment of language models

By: AI Alignment Forum

Source: AI Alignment Forum

What's New

****Claim****

Engaging with AI alignment and values research could lead to improvements in the training decisions of language models.

****Evidence****

Anthropic has indicated that its constitutional approach is subject to revision, suggesting that user feedback may influence future model training. The low probability of any single submission making a significant change is counterbalanced by the cumulative effect of multiple contributions over time.

****Method****

The argument is based on a metaethical framework developed in earlier work, potentially involving philosophical analysis rather than empirical testing.

****Limitations****

The effectiveness of feedback in influencing model training decisions is uncertain and relies on Anthropic's willingness to incorporate external input. There is also a lack of direct empirical evidence connecting user submissions to training outcomes.

****Safety relevance****

This suggests that user engagement in the alignment process may enhance the alignment of future language models with human values.
